## 1. Name of drug product

ARTIMETHER & LUMEFANTRINE TABLETS

### 1.1 (Trade) name of product

JVI ARTIMETHER 20 & LUMEFANTRINE 120 TABLETS

### 1.2 Strength

Each uncoated tablet contains:

Artimether……20 mg,

Lumefantrine……..120 mg

Excipient……..Q.S.

### 1.3 Pharmaceutical Dosage Form

Tablets for oral administration

## 2. QUALITATIVE & QUANTITATIVE COMPOSITION

### 2.1Qualitative Declaration

ARTIMETHER & LUMEFANTRINE TABLETS

Each uncoated tablet contains:

Artimether……20 mg,

Lumefantrine……..120 mg

Excipient……..Q.S.

### 2.2 Quantitative Declaration

**Batch Formula:**

**Batch Size**: 100,000 Tablets

| Sr. No | Ingredients | Grade | Rationale | Label Claim | Quantity per Unit (mg) | Quantity per Batch (Actual-Kg) |
|---|---|---|---|---|---|---|
| | **Mixing** | | | | | |
| 1. | Lumefantrine | USP | Active | 120 | 120 | 12.0 |
| 2. | Hypermellose | BP | stabilizing agent | --- | 10 | 1.0 |
| 3. | Polysorbit 80 | BP | Solubilizer | --- | 5 | 0.5 |
| 4. | Maize Starch | BP | Diluent | --- | 44 | 4.4 |

| 13. | Maize starch | BP | Diluent | --- | 1 | 0.1 |

## 3. PHARMACEUTICAL DOSAGE FORM

Tablet for oral administration

## 4. CLINICAL PARTICULARS

### 4.1 Therapeutic Indications

Artimether And Lumefantrine is indicated for the treatment of acute uncomplicated Plasmodium falciparum malaria in adults, children and infants of 5 kg and above.

Consideration should be given to official guidance regarding the appropriate use of Antimalarials agents.

### 4.2 Posology and Method of Administration

Posology

Adults and children weighing 35 kg and above

For patients 12 years of age and above and 35 kg body weight and above, a course of treatment comprises six doses of four tablets i.e. total of 24 tablets, given over a period of 60 hours as follows: the first dose of four tablets, given at the time of initial diagnosis, should be followed by five further doses of four tablets given at 8, 24, 36, 48 and 60 hours thereafter.

Children and infants weighing 5 kg to less than 35 kg

A six-dose regimen is recommended with 1 to 3 tablets per dose, depending on bodyweight:

5 to less than 15 kg bodyweight: the first dose of one tablet, given at the time of initial diagnosis, should be followed by five further doses of one tablet given at 8, 24, 36, 48 and 60 hours thereafter.

15 to less than 25 kg bodyweight: the first dose of two tablets, given at the time of initial diagnosis, should be followed by five further doses of two tablets given at 8, 24, 36, 48 and 60 hours thereafter.

25 to less than 35 kg bodyweight: the first dose of three tablets, given at the time of initial diagnosis, should be followed by five further doses of three tablets given at 8, 24, 36, 48 and 60 hours thereafter.

Method of administration Tablets for oral administration.

To increase absorption, ARTIMETHER AND LUMEFANTRINE should be taken with food or a milky drink (see section 5.2). If patients are unable to tolerate food, ARTIMETHER AND LUMEFANTRINE should be administered with water, but the systemic exposure may be reduced. Patients who vomit within 1 hour of taking the medication should repeat the dose. For administration to small children and infants, the tablet/s may be crushed.

## 4.3 Contraindications

ARTIMETHER AND LUMEFANTRINE is contraindicated in:

• patients with known hypersensitivity to the active substances or to any of the excipients listed in section 6.1.

• patients with severe malaria according to WHO definition*.

• patients who are taking any drug which is metabolised by the cytochrome enzyme CYP2D6 (e.g. metoprolol, imipramine, amitryptyline, clomipramine).

• patients with a family history of sudden death or of congenital prolongation of the QTc interval on electrocardiograms, or with any other clinical condition known to prolong the QTc interval.

• patients taking drugs that are known to prolong the QTc interval (proarrythmic). These drugs include:

- antiarrhythmics of classes IA and III,

- neuroleptics, antidepressive agents,

- certain antibiotics including some agents of the following classes:
macrolides, fluoroquinolones, imidazole and triazole antifungal agents,

- certain non-sedating antihistamines (terfenadine, astemizole),

- cisapride.

- flecainide

• patients with a history of symptomatic cardiac arrythmias or with clinically relevant bradycardia or with congestive cardiac failure accompanied by reduced left ventricle ejection fraction.

• patients with disturbances of electrolyte balance e.g. hypokalemia or hypomagnesemia.

• patients taking drugs that are strong inducers of CYP3A4 such as rifampin, carbamazepine, phenytoin, St. John's wort (*Hypericum perforatum*).

(*Presence of one or more of the following clinical or laboratory features:

Clinical manifestation: Prostration; impaired consciousness or unarousable coma; failure to feed; deep breathing, respiratory distress (acidotic breathing); multiple convulsions; circulatory collapse or shock; pulmonary edema (radiological); abnormal bleeding; clinical jaundice; hemoglobinuria

Laboratory test: Severe normocytic anemia; hemoglobuniuria; hypoglycemia; metabolic acidosis; renal impairment; hyperlactatemia; hyperparasitemia)

## 4.4 Special Warnings and Precautions for Use

Artimether and Lumefantrine must not be used in the first trimester of pregnancy in situations where other suitable and effective antimalarials are available (see section 4.6).

Artimether and Lumefantrine has not been evaluated for the treatment of severe malaria, including cases of cerebral malaria or other severe manifestations such as pulmonary oedema or renal failure.

Due to limited data on safety and efficacy, ARTIMETHER AND LUMEFANTRINE should not be given concurrently with any other antimalarial agent (see section 4.5) unless there is no other treatment option.

If a patient deteriorates whilst taking ARTIMETHER AND LUMEFANTRINE TABLETS, alternative treatment for malaria should be started without delay. In such cases, monitoring of the ECG is recommended and steps should be taken to correct any electrolyte disturbances.

The long elimination half-life of lumefantrine must be taken into account when administering quinine in patients previously treated with ARTIMETHER AND LUMEFANTRINE TABLETS.

If quinine is given after ARTIMETHER AND LUMEFANTRINE TABLETS, close monitoring of the ECG is advised (see section 4.5).

If ARTIMETHER AND LUMEFANTRINE is given after mefloquine, close monitoring of food intake is advised (see section 4.5).

In patients previously treated with halofantrine, ARTIMETHER AND LUMEFANTRINE should not be administered earlier than one month after the last halofantrine dose.

ARTIMETHER AND LUMEFANTRINE is not indicated and has not been evaluated for prophylaxis of malaria.

ARTIMETHER AND LUMEFANTRINE should be used cautiously in patients on anti-retroviral drugs (ARTs) since decreased Artimether, DHA, and/or lumefantrine concentrations may result in a decrease of antimalarial efficacy of ARTIMETHER AND LUMEFANTRINE TABLETS, (see section 4.5).

Like other antimalarials (e.g. halofantrine, quinine and quinidine) ARTIMETHER AND LUMEFANTRINE has the potential to cause QT prolongation (see section 5.1).

Caution is recommended when combining ARTIMETHER AND LUMEFANTRINE with drugs exhibiting variable patterns of inhibition, moderate induction or competition for CYP3A4 as the therapeutic effects of some drugs could be altered. Drugs that have a mixed inhibitory/induction effect on CYP3A4, especially anti-retroviral drugs such as HIV protease inhibitors and non-nucleoside reverse transcriptase inhibitors should be used with caution in patients taking ARTIMETHER AND LUMEFANTRINE (see sections 4.5 and 5.2).

Caution is recommended when combining ARTIMETHER AND LUMEFANTRINE with hormonal contraceptives. ARTIMETHER AND LUMEFANTRINE may reduce the effectiveness of hormonal contraceptives. Therefore, patients using oral, transdermal patch, or other systemic hormonal contraceptives should be advised to use an additional non-hormonal method of birth control for about one month (see sections 4.5).

Patients who remain averse to food during treatment should be closely monitored as the risk of recrudescence may be greater.

Renal impairment

No specific studies have been carried out in this group of patients. There is no significant renal excretion of lumefantrine, Artimether and dihydroartemisinin in studies conducted in healthy volunteers and clinical experience is limited. No dose adjustment for the use of ARTIMETHER AND LUMEFANTRINE in patients with renal impairment is recommended. Caution is advised when administering ARTIMETHER AND LUMEFANTRINE to patients with severe renal impairment. In these patients, ECG and blood potassium monitoring is advised.

Hepatic impairment

No specific studies have been carried out in this group of patients. In patients with severe hepatic impairment, a clinically relevant increase of exposure to Artimether and Lumefantrine and/or their metabolites cannot be ruled out. Therefore caution should be exercised in dosing patients with severe hepatic impairment (see section 5.2). In these

patients, ECG and blood potassium monitoring is advised. No dose adjustment is recommended for patients with mild to moderate hepatic impairment.

Older people

There is no information suggesting that the dosage in patients over 65 years of age should be different than in younger adults.

New infections

Data for a limited number of patients in a malaria endemic area show that new infections can be treated with a second course of ARTIMETHER AND LUMEFANTRINE TABLETS. In the absence of carcinogenicity study data, and due to lack of clinical experience, more than two courses of ARTIMETHER AND LUMEFANTRINE cannot be recommended.

## 4.5 Interaction with Other Drugs, Other Forms of Interactions

**Contraindications of concomitant use**

Interaction with drugs that are known to prolong the QTc interval

ARTIMETHER AND LUMEFANTRINE is contraindicated with concomitant use of drugs (they may cause prolonged QTc interval and Torsade de Pointes) such as: antiarrhythmics of classes IA and III, neuroleptics and antidepressant agents, certain antibiotics including some agents of the following classes: macrolides, fluoroquinolones, imidazole, and triazole antifungal agents, certain non-sedating antihistaminics (terfenadine, astemizole), cisapride, flecainide (see section 4.3)

Interaction with drugs metabolized by CYP2D6

Lumefantrine was found to inhibit CYP2D6 in vitro. This may be of particular clinical relevance for compounds with a low therapeutic index. Co-administration of ARTIMETHER AND LUMEFANTRINE with drugs that are metabolised by this iso-enzyme is

contraindicated (e.g. neuroleptics, metoprolol, and tricyclic antidepressants such as imipramine, amitriptyline, clomipramine) is contraindicated (see sections 4.3 and 5.2).

Interaction with strong inducers of CYP3A4 such as rifampin

Oral administration of rifampin (600 mg daily), a strong CYP3A4 inducer, with JVI ARTIMETHER 20 & LUMEFANTRINE 120 TABLETS(6-dose regimen over 3 days) in six HIV-1 and tuberculosis coinfected adults without malaria resulted in significant decreases in exposure to Artimether (89%), DHA (85%) and lumefantrine (68%) when compared to exposure values after ARTIMETHER AND LUMEFANTRINE alone. Concomitant use of strong inducers of CYP3A4 such as rifampin, carbamazepine, phenytoin, St. John's Wort is contraindicated with ARTIMETHER AND LUMEFANTRINE (see section 4.3).

Inducers should not be administered at least one month after ARTIMETHER AND LUMEFANTRINE administration, unless critical to use as judged by the prescriber.

**Concomitant use not recommended**

Interaction with other antimalarial drugs (see section 4.4)

Data on safety and efficacy are limited, and ARTIMETHER AND LUMEFANTRINE should therefore not be given concurrently with other antimalarials unless there is no other treatment option (see section 4.4).

If ARTIMETHER AND LUMEFANTRINE is given following administration of mefloquine or quinine, close monitoring of food intake (for mefloquine) or of the ECG (for quinine) is advised. The long elimination half-life of lumefantrine must be taken into account when administering quinine in patients previously treated with ARTIMETHER AND LUMEFANTRINE TABLETS. In patients previously treated with halofantrine, ARTIMETHER AND LUMEFANTRINE should not be administered earlier than one month after the last halofantrine dose (see section 4.4).

Mefloquine

A drug interaction study with ARTIMETHER AND LUMEFANTRINE in man involved administration of a 6-dose regimen over 60 hours in healthy volunteers which was commenced at 12 hours after completion of a 3-dose regimen of mefloquine or placebo. Plasma mefloquine concentrations from the time of addition of ARTIMETHER AND LUMEFANTRINE were not affected compared with a group which received mefloquine followed by placebo.

Pre-treatment with mefloquine had no effect on plasma concentrations of Artimether or the Artimether/dihydroartemisinin ratio but there was a significant reduction in plasma levels of lumefantrine, possibly due to lower absorption secondary to a mefloquine-induced decrease in bile production. Patients should be encouraged to eat at dosing times to compensate for the decrease in bioavailability.

Quinine

A drug interaction study in healthy male volunteers showed that the plasma concentrations of lumefantrine and quinine were not affected when i.v. quinine (10 mg/kg BW over 2 hours) was given sequentially 2 hours after the last (sixth) dose of ARTIMETHER AND LUMEFANTRINE (so as to produce concurrent plasma peak levels of lumefantrine and quinine). Plasma concentrations of Artimether and dihydroartemisinin (DHA) appeared to be lower. In this study, administration of ARTIMETHER AND LUMEFANTRINE to 14 subjects had no effect on QTc interval. Infusion of quinine alone in 14 other subjects caused a transient prolongation of QTc interval, which was consistent with the known cardiotoxicity of quinine. This effect was slightly, but significantly, greater when quinine was infused after ARTIMETHER AND LUMEFANTRINE in 14 additional subjects. It would thus appear that the inherent risk of QTc prolongation associated with i.v. quinine was enhanced by prior administration of ARTIMETHER AND LUMEFANTRINE TABLETS.

**Concomitant use requiring caution**

**Interactions affecting the use of ARTIMETHER AND LUMEFANTRINE TABLETS**

Interaction with CYP3A4 inhibitors

Both Artimether and Lumefantrine are metabolised predominantly by the cytochrome enzyme CYP3A4, but do not inhibit this enzyme at therapeutic concentrations.

Ketoconazole

The concurrent oral administration of ketoconazole with ARTIMETHER AND LUMEFANTRINE led to a modest increase (≤ 2-fold) in Artimether, DHA, and lumefantrine exposure in healthy adult subjects. This increase in exposure to the antimalarial combination was not associated with increased side effects or changes in electrocardiographic parameters. Based on this study, dose adjustment of ARTIMETHER AND LUMEFANTRINE is considered unnecessary in falciparum malaria patients when administered in association with ketoconazole or other potent CYP3A4 inhibitors.

ARTIMETHER AND LUMEFANTRINE should be used cautiously with drugs that inhibit CYP3A4 and are contraindicated with drugs which additionally are known to prolong QTc (see Section 4.3 Contraindications), due to potential for increased concentrations of lumefantrine which could lead to QT prolongation.

Interaction with weak to moderate inducers of CYP3A4

When ARTIMETHER AND LUMEFANTRINE is co-administered with moderate inducers of CYP3A4, it may result in decreased concentrations of Artimether and/or lumefantrine and loss of antimalarial efficacy (see section 4.4).

Interaction with anti-retroviral drugs such as protease inhibitors and non-nucleoside reverse transcriptase inhibitors

Both Artimether and Lumefantrine are metabolized by CYP3A4. ARTs, such as protease inhibitors and non-nucleoside reverse transcriptase inhibitors, are known to have variable patterns of inhibition, induction or competition for CYP3A4. ARTIMETHER AND LUMEFANTRINE should be used cautiously in patients on ARTs since decreased Artimether, DHA, and/or lumefantrine concentrations may result in a decrease of antimalarial efficacy of ARTIMETHER AND LUMEFANTRINE TABLETS, and increased lumefantrine concentrations may cause QT prolongation (see Section 4.4).

Lopinavir/ritonavir

In a clinical study in healthy volunteers, lopinavir/ritonavir decreased the systemic exposures to Artimether and DHA by approximately 40% but increased the exposure to lumefantrine by approximately 2.3- fold. Exposures to lopinavir/ritonavir were not significantly affected by concomitant use of ARTIMETHER AND LUMEFANTRINE TABLETS.

Nevirapine

In a clinical study in HIV-infected adults, nevirapine significantly reduced the median Cmax and AUC of Artimether by approximately 61% and 72%, respectively and reduced the median Cmax and AUC of dihydroartemisinin by approximately 45% and 37%, respectively. Lumefantrine Cmax and AUC were non-significantly reduced by nevirapine. Artimether/lumefantrine reduced the median Cmax and AUC of nevirapine by approximately 43% and 46% respectively.

Efavirenz

Efavirenz decreased the exposures to Artimether, DHA, and lumefantrine by approximately 50%, 45%, and 20%, respectively. Exposures to efavirenz were not significantly affected by concomitant use of ARTIMETHER AND LUMEFANTRINE TABLETS.

**Interactions resulting in effects of ARTIMETHER AND LUMEFANTRINE on other drugs**

Interaction with drugs metabolized by CYP450 enzymes

When ARTIMETHER AND LUMEFANTRINE is co-administered with substrates of CYP3A4 it may result in decreased concentrations of the substrate and potential loss of substrate efficacy. Studies in humans have demonstrated that artemisinins have some capacity to induce CYP3A4 and CYP2C19 and inhibit CYP2D6 and CYP1A2. Although the magnitude of the changes was generally low it is possible that these effects could alter the therapeutic response of drugs that are predominantly metabolised by these enzymes (see sections 4.4 and 5.2).

Interaction with hormonal contraceptives

In vitro, the metabolism of ethinyl estradiol and levonorgestrel was not induced by Artimether, DHA, or lumefantrine. However, Artimether has been reported to weakly induce, in humans, the activity of CYP2C19, CYP2B6, and CYP3A. Therefore, ARTIMETHER AND LUMEFANTRINE may potentially reduce the effectiveness of hormonal contraceptives. Patients using oral, transdermal patch, or other systemic hormonal contraceptives should be advised to use an additional nonhormonal method of birth control for about one month (see sections 4.4 and 4.6).

Drug-food/drink interactions

ARTIMETHER AND LUMEFANTRINE should be taken with food or drinks rich in fat such as milk as the absorption of both Artimether and Lumefantrine is increased (see Section 4.2).

Grapefruit juice should be used cautiously during ARTIMETHER AND LUMEFANTRINE treatment. Administration of Artimether with grapefruit juice in healthy adult subjects resulted in an approximately two fold increase in systemic exposure to the parent drug.

**4.6 Fertility, pregnancy and lactation**

Women of childbearing potential

Women using oral, transdermal patch, or other systemic hormonal contraceptives should be advised to use an additional non-hormonal method of birth control for about one month (see section 4.4).

Pregnancy

Based on animal data, ARTIMETHER AND LUMEFANTRINE is suspected to cause serious birth defects when administered during the first trimester of pregnancy (see sections 4.4 and 5.3) Reproductive studies with Artimether have shown evidence of post-implantation losses and teratogenicity in rats and rabbits. Other artemisinin derivatives have also demonstrated teratogenic potential with an increased risk during early gestation (see section 5.3).

Safety data from an observational pregnancy study of approximately 500 pregnant women who were exposed to ARTIMETHER AND LUMEFANTRINE (including a third of patients who were exposed in the first trimester), and published data of another over 500 pregnant women who were exposed to Artimether- lumefantrine (including over 50 patients who were exposed in the first trimester), as well as published data of over 1,000 pregnant women who were exposed to artemisinin derivatives, did not show an increase in adverse pregnancy outcomes or teratogenic effects over background rates.

ARTIMETHER AND LUMEFANTRINE treatment must not be used during the first trimester of pregnancy in situations where other suitable and effective antimalarials are available (see section 4.4). However, it should not be withheld in life-threatening situations, where no other effective antimalarials are available. During the second and third trimester, treatment should only be considered if the expected benefit to the mother outweighs the risk to the foetus.

Breast-feeding

Animal data suggest excretion into breast milk but no data are available in humans. Women taking ARTIMETHER AND LUMEFANTRINE should not breast-feed during their treatment. Due to the long elimination half-life of lumefantrine (2 to 6 days), it is recommended that breast-feeding should not resume until at least one week after the last dose of ARTIMETHER AND LUMEFANTRINE unless potential benefits to the mother and child outweigh the risks of ARTIMETHER AND LUMEFANTRINE treatment.

Fertility

There is no information on the effects of ARTIMETHER AND LUMEFANTRINE on human fertility (see section 5.3).

## 4.7 Effects on ability to drive and operate machine

Patients receiving ARTIMETHER AND LUMEFANTRINE should be warned that dizziness or fatigue/asthenia may occur in which case they should not drive or use machines.

## 4.8 Undesirable effects

The safety of ARTIMETHER AND LUMEFANTRINE has been evaluated in 20 clinical trials with more than 3500 patients. A total of 1810 adults and adolescents above 12 years of age as well as 1788 infants and children of 12 years of age and below have received ARTIMETHER AND LUMEFANTRINE in clinical trials.

Adverse reactions reported from clinical studies and post-marketing experience are listed below according to system organ class.

Adverse reactions are ranked under headings of frequency using the MedDRA frequency convention:

Very common (≥1/10)

Common (≥1/100 to <1/10)

Uncommon (≥1/1,000 to <1/100)

Rare (≥1/10,000 to <1/1,000)

Very rare (<1/10,000)

Not known (cannot be estimated from available data).

**Table 1 Frequency of Undesirable effects**

| | Adults and adolescents above 12 years of age | Infants and children of 12 years of age and below (incidence estimates) |
|---|---|---|
| **Immune system disorders** | | |
| Hypersensitivity | Not known | Rare |
| **Metabolism and nutrition disorders** | | |
| Decreased appetite | Very common | Very common (16.8 %) |
| **Psychiatric disorders** | | |
| Sleep disorders | Very common | Common (6.4 %) |
| Insomnia | Common | Uncommon |
| **Nervous system disorders** | | |
| Headache | Very common | Very common (17.1 %) |
| Dizziness | Very common | Common (5.5 %) |
| Paraesthesia | Common | -- |
| Ataxia, hypoaesthesia | Uncommon | -- |
| Somnolence | Uncommon | Uncommon |
| Clonus | Common | Uncommon |

| | | |
|---|---|---|
| **Cardiac disorders** | | |
| Palpitations | Very common | Common (1.8 %) |
| Electrocardiogram QT prolonged | Common | Common (5.3 %) |
| **Respiratory, thoracic and mediastinal disorders** | | |
| Cough | Common | Very common (22.7 %) |
| **Gastrointestinal disorders** | | |
| Vomiting | Very common | Very common (20.2 %) |
| Abdominal pain | Very common | Very common (12.1 %) |
| Nausea | Very common | Common (6.5 %) |
| Diarrhoea | Common | Common (8.4 %) |
| **Hepatobiliary disorders** | | |
| Liver function tests increased | Uncommon | Common (4.1 %) |
| **Skin and subcutaneous tissue disorders** | | |
| Rash | Common | Common (2.7 %) |
| Pruritus | Common | Uncommon |
| Urticaria | Uncommon | Uncommon |
| Angioedema* | Not known | Not known |
| **Musculoskeletal and connective tissue disorders** | | |
| Arthralgia | Very common | Common (2.1 %) |
| Myalgia | Very common | Common (2.2 %) |
| **General disorders and administration site conditions** | | |
| Asthenia | Very common | Common (5.2 %) |
| Fatigue | Very common | Common (9.2 %) |
| Gait disturbance | Common | -- |

*: These adverse reactions were reported during post-marketing experience. Because these spontaneously reported events are from a population of uncertain size, it is difficult to estimate their frequency.

## 4.9 Overdose

In cases of suspected over dosage symptomatic and supportive therapy should be given as appropriate, which should include ECG and blood potassium monitoring.

# 5. Pharmacological properties

## 5.1 Pharmacodynamic properties

Pharmacotherapeutic group: antimalarials, blood schizontocide, ATC code: P01 BF01.

Pharmacodynamic effects

ARTIMETHER AND LUMEFANTRINE comprises a fixed ratio of 1:6 parts of Artimether and Lumefantrine, respectively. The site of antiparasitic action of both components is the food vacuole of the malarial parasite, where they are thought to interfere with the conversion of haem, a toxic intermediate produced during haemoglobin breakdown, to the nontoxic haemozoin, malaria pigment. Lumefantrine is thought to interfere with the polymerisation process, while Artimether generates reactive metabolites as a result of the interaction between its peroxide bridge and haem iron. Both Artimether and Lumefantrine have a secondary action involving inhibition of nucleic acid- and protein synthesis within the malarial parasite.

Treatment of Acute Uncomplicated P. falciparum Malaria

The efficacy of JVI ARTIMETHER 20 & LUMEFANTRINE 120 TABLETS was evaluated for the treatment of acute, uncomplicated malaria (defined as symptomatic P. falciparum malaria without signs and symptoms of severe malaria or evidence of vital organ dysfunction) in five 6-dose regimen studies and one study comparing the 6-dose regimen with the 4-dose regimen. Baseline parasite density ranged from 500/µL - 200,000/µL (0.01% to 4% parasitemia) in the majority of patients. Studies were conducted in otherwise healthy, partially immune or non-immune adults and children (≥5kg body weight) with uncomplicated malaria in Thailand, sub-Saharan Africa, Europe, and South America.

Efficacy endpoints consisted of:

• 28-day cure rate, proportion of patients with clearance of asexual parasites within 7 days without recrudescence by day 28

• parasite clearance time (PCT), defined as time from first dose until first total and continued disappearance of asexual parasite which continues for a further 48 hours

• fever clearance time (FCT), defined as time from first dose until the first time body temperature fell below 37.5°C and remained below 37.5°C for at least a further 48 hours (only for patients with temperature >37.5°C at baseline)

The modified intent to treat (mITT) population includes all patients with malaria diagnosis confirmation who received at least one dose of study drug. Evaluable patients generally are all patients who had a day 7 and a day 28 parasitological assessment or experienced treatment failure by day 28. The results are presented in the table below:

**Table 2 Clinical efficacy results**

| Study No. | Age | Polymerase chain reaction (PCR)-corrected 28-day cure rate[1] n/N (%) in evaluable patients | Median FCT[2] [25th, 75th percentile] | Median PCT[2] [25th, 75th percentile] | Year/ Study location |
|---|---|---|---|---|---|

2 mITT population

3 For patients who had a body temperature >37.5°C at baseline only

4Only the 6-dose regimen over 60 hours group data is presented CT

–JVI ARTIMETHER 20 & LUMEFANTRINE 120 TABLETS

administered as crushed tablets

DT –ARTIMETHER AND LUMEFANTRINE Dispersible tablets

ARTIMETHER AND LUMEFANTRINE is not indicated for, and has not been evaluated in, the treatment of malaria due to P. vivax, P. malariae or P. ovale, although some patients in clinical studies had co-infection with P. falciparum and P. vivax at baseline. ARTIMETHER AND LUMEFANTRINE is active against blood stages of Plasmodium vivax, but is not active against hypnozoites.

Paediatric population

Two studies have been conducted

Study A2403 was conducted in Africa in 310 infants and children aged 2 months to 9 years, weighing 5 kg to 25 kg, with an axillary temperature ≥37.5°C. Results of 28-day cure rate (PCR-corrected), median parasite clearance time (PCT), and fever clearance time (FCT) are reported in table 3 below.

Study B2303 was conducted in Africa in 452 infants and children, aged 3 months to 12 years, weighing 5 kg to <35 kg, with fever (≥37.5°C axillary or ≥38°C rectally) or history of fever in the preceding 24 hours. This study compared crushed tablets and dispersible tablets. Results of 28-day cure rate (PCR-corrected), median parasite clearance time (PCT), and fever clearance time (FCT) for crushed tablets are reported in table 3 below.

**Table 3 Clinical efficacy by weight for pediatric studies**

| Study No.<br>Weight category | Median PCT[1]<br>[25th, 75th percentile] | PCR-corrected 28-day cure rate[2]<br>n/N (%) in evaluable patients |
|---|---|---|
| Study A2403 | | |
| 5 - <10 kg | 24 hours [24, 36] | 145/149 (97.3) |
| 10 - <15 kg | 35 hours [24, 36] | 103/107 (96.3) |
| 15 -25 kg | 24 hours [24, 36] | 41/43 (95.3) |
| Study B2303[CT] | | |
| 5 - <10 kg | 36 hours [24, 36] | 65/69 (94.2) |
| 10 - <15 kg | 35 hours [24, 36] | 174/179 (97.2) |
| 15 -<25 kg | 35 hours [24, 36] | 134/140 (95.7) |
| 25-35 kg | 26 hours [24, 36] | 30/31 (96.8) |

[CT] JVI ARTIMETHER 20 & LUMEFANTRINE 120 TABLETSadministered as crushed tablets

**QT/QTc Prolongation**:

Adults and children with malaria

For information on the risk of QT/QTc prolongation in patients see section 4.4

Healthy adults

In a healthy adult volunteer parallel group study including a placebo and moxifloxacin control group (n=42 per group), the administration of the six dose regimen of ARTIMETHER AND LUMEFANTRINE was associated with prolongation of QTcF. The mean changes from baseline at 68, 72, 96, and 108 hours post first dose were 7.45, 7.29, 6.12 and 6.84 msec, respectively. At 156 and 168 hours after first dose, the changes from baseline for QTcF had no difference from zero. No subject had a >30 msec increase from baseline nor an absolute increase to >500 msec. Moxifloxacin control was associated with a QTcF increase as compared to placebo for 12 hours after the single dose with a maximal change at 1 hour after dose of 14.1 msec.

In the adult/adolescent population included in clinical trials, 8 patients (0.8%) receiving ARTIMETHER AND LUMEFANTRINE experienced a QTcB >500 msec and 3 patients (0.4%) a QTcF >500 msec. Prolongation of QTcF interval >30 msec was observed in 36% of patients.

In clinical trials conducted in children with the 6-dose regimen, no patient had post-baseline QTcF >500 msec whereas 29.4% had QTcF increase from baseline >30 msec and 5.1% >60 msec. In clinical trials conducted in adults and adolescents with the 6-dose regimen, post-baseline QTcF prolongation of >500 msec was reported in 0.2% of patients, whereas QTcF increase from baseline >30 msec was reported in 33.9% and >60 msec in 6.2% of patients.

In the infant/children population included in clinical trials, 3 patients (0.2%) experienced a QTcB >500 msec. No patient had QTcF >500 msec. Prolongation of QTcF intervals >30 msec was observed in 34% of children weighing 5-10 kg, 31% of children weighing 10-15 kg and 24% of children weighing 15-25 kg, and 32% of children weighing 25-35 kg.

## 5.2 Pharmacokinetic properties

Pharmacokinetic characterisation of ARTIMETHER AND LUMEFANTRINE is limited by the lack of an intravenous formulation, and the very high inter-and intra-subject variability of Artimether and Lumefantrine plasma concentrations and derived pharmacokinetic parameters (AUC, Cmax).

Absorption

Artimether is absorbed fairly rapidly and dihydroartemisinin, the active metabolite of Artimether, appears rapidly in the systemic circulation with peak plasma concentrations of both compounds reached about 2 hours after dosing. Mean Cmax and AUC values of Artimether ranged between 60.0-104 ng/mL and 146-338 ng·h/mL, respectively, in fed healthy adults after a single dose of ARTIMETHER AND LUMEFANTRINE TABLETS, 80 mg Artimether/480 mg lumefantrine. Mean Cmax and AUC values of dihydroartemisinin ranged between 49.7-104 ng/mL and 169-308 ng·h/mL, respectively. Absorption of lumefantrine, a highly lipophilic compound, starts after a lag-time of up to 2 hours, with peak

plasma concentration (mean between 5.10-9.80 µg/mL) about 6-8 hours after dosing. Mean AUC values of lumefantrine ranged between 108 and 243 µg·h/mL. Food enhances the absorption of both Artimether and Lumefantrine: in healthy volunteers the relative bioavailability of Artimether was increased more than two-fold, and that of lumefantrine sixteen-fold compared with fasted conditions when ARTIMETHER AND LUMEFANTRINE was taken after a high-fat meal.

Food has also been shown to increase the absorption of lumefantrine in patients with malaria, although to a lesser extent (approximately two-fold), most probably due to the lower fat content of the food ingested by acutely ill patients. The food interaction data indicate that absorption of lumefantrine under fasted conditions is very poor (assuming 100% absorption after a high-fat meal, the amount absorbed under fasted conditions would be <10% of the dose). Patients should therefore be encouraged to take the medication with a normal diet as soon as food can be tolerated.

Distribution

Artimether and Lumefantrine are both highly bound to human serum proteins *in vitro* (95.4% and 99.7%, respectively). Dihydroartemisinin is also bound to human serum proteins (47-76%).

Biotransformation

Artimether is rapidly and extensively metabolised (substantial first-pass metabolism) both *in vitro* and in humans. Human liver microsomes metabolise Artimether to the biologically active main metabolite dihydroartemisinin (demethylation), predominantly through the isoenzyme CYP3A4/5. This metabolite has also been detected in humans *in vivo*.

Dihydroartemisinin is further converted to inactive metabolites.

The pharmacokinetics of Artimether in adults is time-dependent. During repeated administration of ARTIMETHER AND LUMEFANTRINE TABLETS, plasma Artimether levels decreased significantly, while levels of the active metabolite (dihydroartemisinin) increased, although not to a statistically significant degree. The ratio of day 3/day 1 AUC for

Artimether was between 0.19 and 0.44, and was between 1.06 and 2.50 for dihydroartemisinin. This suggests that there was induction of the enzyme responsible for the metabolism of Artimether. Artimether and dihydroartemisinin were reported to have a mild inducing effect on CYP3A4 activity. The clinical evidence of induction is consistent with the *in vitro* data described in section 4.5

Lumefantrine is N-debutylated, mainly by CYP3A4, in human liver microsomes. *In vivo* in animals (dogs and rats), glucuronidation of lumefantrine takes place directly and after oxidative biotransformation. In humans, the exposure to lumefantrine increases with repeated administration of ARTIMETHER AND LUMEFANTRINE over the 3-day treatment period, consistent with the slow elimination of the compound (see section 5.2 Elimination). Systemic exposure to the metabolite desbutyl-lumefantrine, for which the *in vitro* antiparasitic effect is 5 to 8 fold higher than that for lumefantrine, was less than 1% of the exposure to the parent drug. Desbutyl-lumefantrine data is not available specifically for an African population. *In vitro,* lumefantrine significantly inhibits the activity of CYP2D6 at therapeutic plasma concentrations (see sections 4.3 and 4.5).

Elimination

Artimether and dihydroartemisinin are rapidly cleared from plasma with a terminal half-life of about 2 hours. Lumefantrine is eliminated very slowly with an elimination half-life of 2 to 6 days. Demographic characteristics such as sex and weight appear to have no clinically relevant effects on the pharmacokinetics of ARTIMETHER AND LUMEFANTRINE TABLETS.

Limited urinary excretion data are available for humans. In 16 healthy volunteers, neither lumefantrine nor Artimether was found in urine after administration of ARTIMETHER AND LUMEFANTRINE TABLETS, and only traces of dihydroartemisinin were detected (urinary excretion of dihydroartemisinin amounted to less than 0.01% of the Artimether dose).

In animals (rats and dogs), no unchanged Artimether was detected in faeces and urine due to its rapid and extensive first-pass metabolism, but numerous metabolites (partly identified)

have been detected in faeces, bile and urine. Lumefantrine was excreted unchanged in faeces and with traces only in urine. Metabolites of lumefantrine were eliminated in bile/faeces.

Dose proportionality

No specific dose proportionality studies were performed. Limited data suggest a dose-proportional increase of systemic exposure to lumefantrine when doubling the ARTIMETHER AND LUMEFANTRINE dose. No conclusive data is available for Artimether.

Bioavailability/bioequivalence studies

Systemic exposure to lumefantrine, Artimether and dihydroartemisinin was similar following administration of ARTIMETHER AND LUMEFANTRINE as dispersible tablets and crushed tablets in healthy adults.

Systemic exposure to lumefantrine was similar following administration of ARTIMETHER AND LUMEFANTRINE dispersible tablets and intact tablets in healthy adults. However, exposure to Artimether and dihydroartemisinin was significantly lower (by 20-35%) for the dispersible than for the intact tablet. These findings are not considered to be clinically relevant for the use of the dispersible tablets in the paediatric population since adequate efficacy of ARTIMETHER AND LUMEFANTRINE dispersible tablets was demonstrated in this population. The dispersible tablet is not recommended for use in adults.

Older people

No specific pharmacokinetic studies have been performed in elderly patients. However, there is no information suggesting that the dosage in patients over 65 years of age should be different than in younger adults.

Paediatric population

In paediatric malaria patients, mean Cmax (CV%) of Artimether (observed after first dose of ARTIMETHER AND LUMEFANTRINE TABLETS) were 223 (139%), 198 (90%) and 174 ng/mL (83%) for body weight groups 5-<15, 15-<25 and 25-<35 kg, respectively, compared

to 186 ng/mL (67%) in adult malaria patients. The associated mean Cmax of DHA were 54.7 (108%), 79.8 (101%) and 65.3 ng/mL (36%), respectively compared to 101 ng/mL (57%) in adult malaria patients. AUC of lumefantrine (population mean, covering the six doses of ARTIMETHER AND LUMEFANTRINE TABLETS) were 577, 699 and 1150 µg•h/mL for paediatric malaria patients in body weight groups 5-<15, 15-<25 and 25-<35 kg, respectively, compared to a mean AUC of 758 µg•h/mL (87%) in adult malaria patients. The elimination half-lives of Artimether and Lumefantrine in children are unknown.

Hepatic and Renal impairment

No specific pharmacokinetic studies have been performed either in patients with hepatic or renal insufficiency or elderly patients. The primary clearance mechanism of both Artimether and Lumefantrine may be affected in patients with hepatic impairment. In patients with severe hepatic impairment, a clinically significant increase of exposure to Artimether and Lumefantrine and/or their metabolites cannot be ruled out. Therefore caution should be exercised in dosing patients with severe hepatic impairment. Based on the pharmacokinetic data in 16 healthy subjects showing no or insignificant renal excretion of lumefantrine, Artimether and dihydroartemisinin, no dose adjustment for the use of ARTIMETHER AND LUMEFANTRINE in patients with renal impairment is advised.

### 5.3 Pre-clinical safety data

General toxicity

The main changes observed in repeat-dose toxicity studies were associated with the expected pharmacological action on erythrocytes, accompanied by responsive secondary haematopoiesis.

Neurotoxicity

Studies in dogs and rats have shown that intramuscular injections of Artimether resulted in brain lesions. Changes observed mainly in brainstem nuclei included chromatolysis, eosinophilic cytoplasmic granulation, spheroids, apoptosis and dark neurons. Lesions were observed in rats dosed for at least 7 days and dogs for at least 8 days, but lesions were not

observed after shorter intramuscular treatment courses or after oral dosing. The estimated Artimether 24 h AUC after 7 days of dosing at the no observed effect level is approximately 7-fold greater or more than the estimated Artimether 24 h AUC in humans. The hearing threshold was affected at 20 dB by oral Artimether administration to dogs at a dose of about 29 times the highest Artimether clinical dose (160 mg/day) based on body surface area comparisons. Most nervous system disorder adverse events in the studies of the 6-dose regimen were mild in intensity and resolved by the end of the study.

Mutagenicity

Artimether and Lumefantrine were not genotoxic/clastogenic based on *in vitro* and *in vivo* testing.

Carcinogenicity

Carcinogenicity studies were not conducted.

Reproductive toxicity studies

Embryotoxicity was observed in rat and rabbit reproductive toxicity studies conducted with Artimether, a derivative of artemisinin. Artemisinins are known to be embryotoxic. Lumefantrine alone caused no sign of reproductive or development toxicity at doses up to 1,000 mg/kg/day in rats and rabbits, doses which are at least 10 times higher than the daily human dose based on body surface area comparisons.

Reproductive toxicity studies performed with the Artimether:lumefantrine combination caused maternal toxicity and increased post-implantation loss in rats and rabbits.

Artimether caused increases in post-implantation loss and teratogenicity (characterised as a low incidence of cardiovascular and skeletal malformations) in rats and rabbits. The embryotoxic Artimether dose in the rat yields Artimether and dihydroartemisinin exposures similar to those achieved in humans based on AUC.

Fertility

Artimether-lumefantrine administration yielded altered sperm motility, abnormal sperm, reduced epididymal sperm count, increased testes weight, and embryotoxicity; other reproductive effects (decreased implants and viable embryos, increased preimplantation loss) were also observed. The no adverse effect level for fertility was 300 mg/kg/day. The relevance to this finding in humans is unknown.

Juvenile toxicity studies

A study investigated the neurotoxicity of oral Artimether in juvenile rats . Mortality, clinical signs and reductions in body weight parameters occurred most notably in younger rats. Despite the systemic toxicity noted, there were no effects of Artimether on any of the functional tests performed and there was no evidence of a direct neurotoxic effect in juvenile rats.

Very young animals are more sensitive to the toxic effect of Artimether than adult animals. There is no difference in sensitivity in slightly older animals compared to adult animals. Clinical studies have established the safety of Artimether and Lumefantrine administration in patients weighing 5 kg and above.

Cardiovascular Safety Pharmacology

In toxicity studies in dogs at doses ≥600 mg/kg/day, there was some evidence of prolongation of the QTc interval (safety margin of 1.3-fold to 2.2-fold for Artimether using calculated free Cmax), at higher doses than intended for use in man. In vitro hERG assays showed a safety margin of >100 for Artimether and dihydroartemisinin. The hERG $IC_{50}$ was 8.1 μM for lumefantrine and 5.5 μM for its desbutyl metabolite.

Based on the available non-clinical data, a potential for QTc prolongation in the human cannot be discounted. For effects in the human see sections 4.3, 4.4 and 5.1.

## 6. Pharmaceutical particulars

### 6.1List of excipients

Hypermellose

Polysorbit 80

Maize Starch

Purified Water

Crosscarmellose Sodium

Purified Talc
